Trust And The Public Good: Examining The Cultural Conditions Of Academic Work

Major themes on the future of the online information environment

THINGS WILL NOT IMPROVE	**Theme 1**	**The information environment will not improve: The problem is human nature**
		• More people = more problems. The internet's continuous growth and accelerating innovation allow more people and artificial intelligence (AI) to create and instantly spread manipulative narratives
		• Humans are by nature selfish, tribal, gullible convenience seekers who put the most trust in that which seems familiar
		• In existing economic, political and social systems, the powerful corporate and government leaders most able to improve the information environment profit most when it is in turmoil
		• Human tendencies and infoglut drive people apart and make it harder for them to agree on "common knowledge." That makes healthy debate difficult and destabilizes trust. The fading of news media contributes to the problem
		• A small segment of society will find, use and perhaps pay a premium for information from reliable sources. Outside of this group "chaos will reign" and a worsening digital divide will develop
	Theme 2	**The information environment will not improve because technology will create new challenges that can't or won't be countered effectively and at scale**
		• Those generally acting for themselves and not the public good have the advantage, and they are likely to stay ahead in the information wars
		• Weaponized narratives and other false content will be magnified by social media, online filter bubbles and AI
		• The most effective tech solutions to misinformation will endanger people's dwindling privacy options, and they are likely to limit free speech and remove the ability for people to be anonymous online
THINGS WILL IMPROVE	**Theme 3**	**The information environment will improve because technology will help label, filter or ban misinformation and thus upgrade the public's ability to judge the quality and veracity of content**
		• Likely tech-based solutions include adjustments to algorithmic filters, browsers, apps and plug-ins and the implementation of "trust ratings"
		• Regulatory remedies could include software liability law, required identities and the unbundling of social networks like Facebook
	Theme 4	**The information environment will improve, because people will adjust and make things better**
		• Misinformation has always been with us and people have found ways to lessen its impact. The problems will become more manageable as people become more adept at sorting through material
		• Crowdsourcing will work to highlight verified facts and block those who propagate lies and propaganda. Some also have hopes for distributed ledgers (blockchain)
MAJOR PROGRAMS ARE NECESSARY	**Theme 5**	**Tech can't win the battle. The public must fund and support the production of objective, accurate information. It must also elevate information literacy to be a primary goal of education**
		• Funding and support must be directed to the restoration of a well-fortified, ethical and trusted public press
		• Elevate information literacy: It must become a primary goal at all levels of education
